

Environmental Policy and Strategy 2026

This strategy complements the general IMS policy for the integrated management system. It includes strategic objectives as well as topic-specific content for the environmental management system of SMA Solar Technology AG and its subsidiaries.

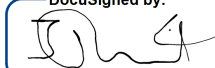

SMA assumes responsibility for the environment and the climate. We shape the energy transition in such a way that our products, processes, and supply chains leave the smallest possible ecological footprint. Our goal is to significantly reduce our environmental impact by 2030. We create transparency regarding emissions and waste across the entire value chain—from development and procurement to delivery and installation. SMA strives to continuously reduce the environmental impacts of its activities and to conserve natural resources. We comply with all applicable legal requirements and aim for further improvements where technically and economically feasible. Environmental aspects are an integral part of our planning, procurement, production, and logistics processes. We promote strong environmental awareness among all employees and work closely with our partners and suppliers to achieve joint progress.

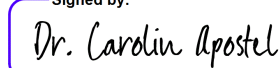

Strategic Target Vision

By 2023, we will

1. Reduce our emissions in the upstream and downstream supply chain (Scope 3).
2. Implement the principles of the circular economy globally.
